

## **Park Manager's Report**

**8/15/2018**

---

**POOL** - Pool Manager just left. He said that the chemicals were in balance, and the guards checked what they were supposed to. He took the cover off of the filter, and pulled out a huge hairball. He didn't know how it got past the screens, but it reduced the suction, and therefore the filtering process. He added a little more chlorine, but still in acceptable levels. It is safe to swim in, and the pool is open, although it may be a while until it clears up completely. This also affected the ability for the vacuum to operate properly, which may be why people have said that there is sand on the bottom.
